Performance on the Stroop color–word test was assessed in 30 healthy male and female adults. Olfactory abilities were assessed using the "Sniffin' Sticks" test and the olfactory Stroop Color and Word Test: Manual for Clinical and Experimental Uses. Abstract. Background: Functional neuroimaging has great potential to inform clinical decision-making in psychiatric disorders. Instead of focusing solely on statistical significance, a clinical relevance study is proposed to evaluate the practical implications of neuroimaging findings.

This meta-analysis covers all age groups and all Stroop test variants, and it includes a range of clinical and psychological assessment tools. Golden's method correction for base-word reading is inadequate, and the results of this study provide a more accurate assessment of the effects of age and gender on Stroop performance. The data are reported in detail in the references of clinical and psychological assessment: Golden C. Stroop Color and Word Test: Manual for Clinical and Experimental Uses.
and Experimental Uses. Stoeling. Chicago.

Demographic features of both groups and clinical features of patients are Stroop Color and Word Test: Manual for Clinical and Experimental Uses. Chicago:
